BTRUST BITCOIN BUILD-A-THON · DEVFEST KADUNA 2026

FIREWATCH

Tells a Lightning node operator, in minutes, whether a published security flaw affects their node, and what the developers said to do.

Dave · Isaac · Patrick

github.com/Chibey-max/Firewatch

2 Oct 2026

Core Lightning warns that attackers are targeting nodes still on 26.06.7 or earlier.

7 Aug 2026

BTCPay Server confirms attackers took LND credentials from unpatched servers, and stole funds.

Would you have known your node was one of them?

Sources: Cointelegraph, 2 Oct 2026 · BTCPay Server security advisory 2.4.2

Fixes ship in days. Operators hear late.

The warning never reaches the node

Core Lightning's August warning went out on Discord, with no CVE. Operators who weren't watching never saw it.

A version number can't say if you're exposed

LND's DNS-seed panic only matters where DNS bootstrapping runs, by default on mainnet. A version check flags every regtest node too.

The right move changes

Usually it's "upgrade". In August it was "restart with `--offline`", before any fix existed. Operators need the developers' exact words.

Sources: Decrypt and The Defiant, Aug 2026 · Lightning Labs advisory, 21 Sep 2026

One answer per advisory. Never a guess.

AFFECTED

The version is in range and every condition is confirmed. Firewatch quotes the developers’ fix and links their notes.

CAN’T TELL

Something can’t be read over RPC, or the node can’t be reached. Firewatch lists what to check by hand.

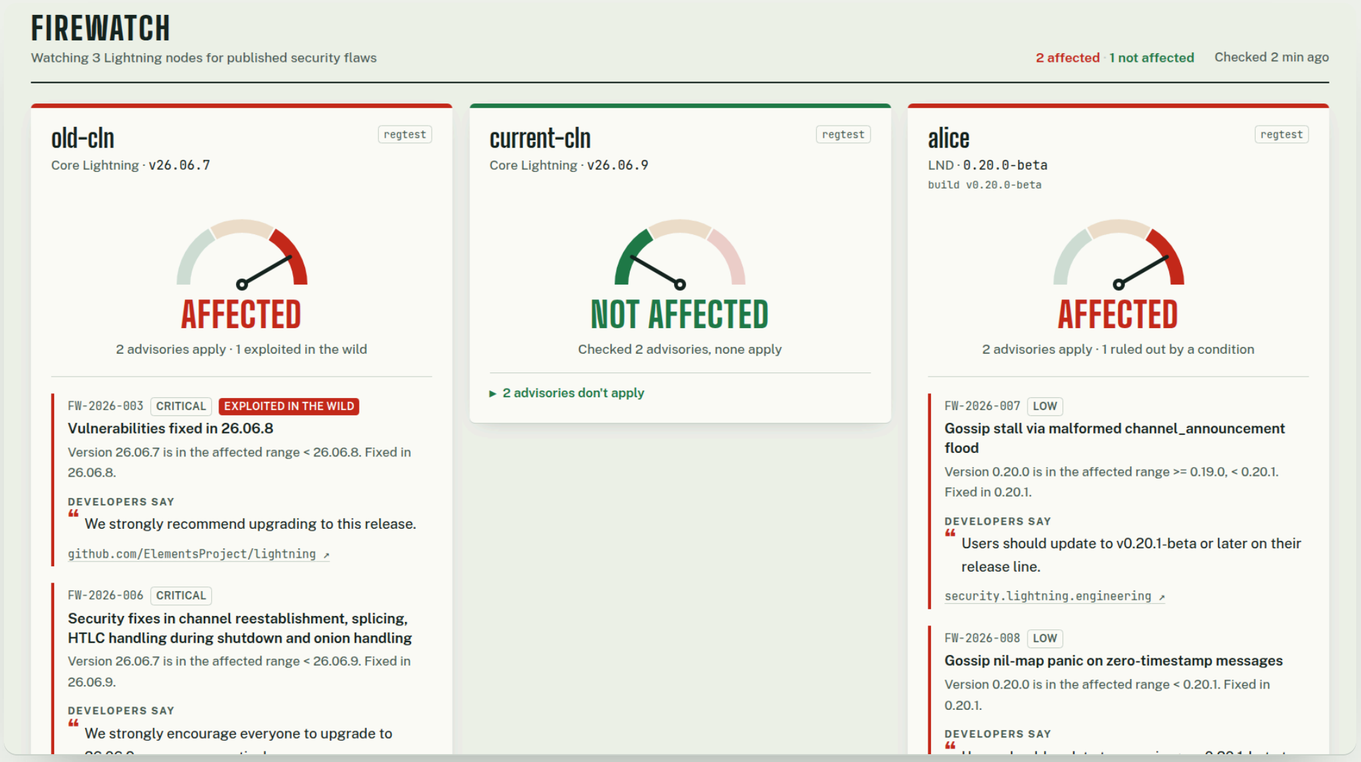

NOT AFFECTED

Outside the range, or a condition rules it out, and Firewatch shows which one.

A node no advisory applies to reads “No known advisories”, never green. Unsure is always amber.

Live: three nodes on a Polar network

1. **`old-cln`**, Core Lightning 26.06.7: red, one advisory exploited in the wild
2. **`alice`**, LND 0.20.0: red, and the DNS-seed bug ruled out on regtest
3. **`current-cln`** stopped on stage: amber, never green
4. **`old-cln`** upgraded by hand: green, and the phone says so

Fallback if Polar fails: the dashboard's ?fixture=demo and ?fixture=demo-after

Built so it can’t make things worse

Read-only credentials

A Core Lightning rune limited to `getinfo` and `listconfigs`, and LND’s readonly macaroon. Anything that can write is refused.

The developers’ own words

Every fix is quoted from the project’s release notes or advisory, with the link. Firewatch never writes its own remediation.

Verified sources only

An advisory runs only once it’s checked against the developers’ page. A bug known only from the news stays off.

Private alerts

Status changes go to the operator as NIP-17 encrypted Nostr DMs, so nobody else learns which node is exposed.

Fixes ship in days. Firewatch makes sure you hear in minutes.

NEXT

Propose our advisory format to the community list, lightning-vulns, so anyone can add an advisory by pull request.

WHO IT'S FOR

The node operators Kaduna's bootcamps are training, who shouldn't learn about an exploit from X.
